The double bar ColorBar runs two full 6061-T6 aluminum extrusions per row instead of one. Each bar carries three internal support ribs and runs continuously through the upper and lower channels of a shared double bar bracket mounted on top of an MRM screw-down base. The result is a snow rail with roughly twice the cross-sectional holding area of a single bar system, paired with the deflection resistance of a structural aluminum extrusion - and the only aluminum double bar system on the market with a front-face ColorStrip channel for architectural panel match.

Placement in just isolated areas such as chimneys, doorways, vents and partial roof sections is NOT recommended.
