The SnoBar Double Bar Screw Down Snow Rail is the heavy-duty configuration of the original SnoBar snow retention system, purpose-built for exposed fastener metal roofs. Two Gator Shield galvanized 1" square steel bars run continuously across the roof, mechanically fastened through the panel into the structural purlin below. Contractors specify this double bar configuration when single bar snow rails may not provide enough retention for the roof conditions - commercial buildings, steep-slope roofs, heavy-snow regions, and any roof where a slide event creates liability exposure.

Placement in just isolated areas such as chimneys, doorways, vents and partial roof sections is NOT recommended.
