(2) 1-5/8" Unistrut Defender Series 27" Long Bars

Compatible with Starlink

When a heavy-duty satellite mounting solution is desired, this satellite mount will not disappoint. The SataMount™ premium satellite mounting bracket for screw-down metal roofs is a heavy-duty, universal-fit solution for attaching satellite dishes and more. A satellite dish is merely shown for illustration and is not actually included. This system works with most satellite dishes, including Starlink V1 and V2. Additionally, SataMount™ works well for installing conduits, solar microinverters, electrical junction boxes, and just about everything else that needs to be mounted to a screw-down metal roof.

The SataMount MRM (Metal Roof Mount) screw-down roof satellite mount system is the preferred choice for homeowners, building owners, contractors, and satellite businesses alike. The SataBracket will fit any screw-down metal roof that has at least 1.5 inches of flat area. The SataBracket is designed to screw into the metal roof panel flats on exposed fastener systems. Most R-Panel manufacturers recommend screwing into the flat portion of the metal roof panel to avoid roof leaks. Thanks to its flexible design and precise manufacturing, the SataMount MRM fits securely and seamlessly on a variety of screw-down metal roofs, eliminating the need for product modifications. This product may also be used on shingle roofs with the proper preparation.

Most standing seam, concealed fastener, floating metal roofs cannot accept screw fasteners and will require the SataMount RCT with roof clamps.
